The World Health Organization says 40% of the world's population suffers from allergies!

The number one among allergy triggers are allergens.

Where we stay particularly long time, in textiles such as mattresses, which we can not wash are infection stoves.

Even apparently clean mattresses have a very high infection potential.

In the hotel there are other infections, with pathogens.

Hotel mattresses are used every year by more than 120 people from all over the world. These leave a total of about 180 liters of body washing in the mattress per year. Connected to constantly newly introduced mites, viruses, bacteria and fungal spores.

(There are more than 50 known notifiable pathogens, which are dangerous and contagious to us, which can also be transmitted via shared textiles.)

We checked hundreds of hotel mattresses and informed the managers of the results.

Although the safe protection of the guests does not cost 10 cents, this measure is denied on the grounds that no budget is available for it.

If the guest would see what he was sleep on, he would not make a booking there.

Surveys have revealed that guests would like to pay more if you can be guaranteed to sleep on a freshly disinfected and allergen-free mattress!

Are operators hiding behind the invisibility of these infection risks?

THMS advocates for the adoption of textile hygiene regulation, to protect against infection of all users collectively used textiles.

The mites: The excretions of these spiders contain an enzyme that can damage our immune system.

The Scabies or German Krätzmilben are even more dangerous. They lay their eggs under the skin and multiply. First signs are itching and skin redness.

This mite species is also highly contagious !!!

A damaged immune system does not provide sufficient protection against pathogens of all kinds. Whether allergens from excretions of mites, viruses, bacteria and fungal spores that have been left there by previous users.

These dangers exist and unfortunately there are no allergen-free mattresses.

And the freshly washed new bedding is unfortunately not sufficient protection from what is in the mattress and head pillow.

That is why it is absolutely important to kill the main culprit after each guest exchange.

Every untreated mattress, even when it looks clean, is full of parasites and their excrements, fungus spores, bacteria and possibly viruses, which are a risk of infection despite freshly washed linens.

How can you protect yourself against the dangers of infection through shared textiles? With a single product that solves all problems at once, the THMS is certified textile hygiene spray.

Textile hygiene is the safest way to protect against infections, even through shared textiles. Accommodation companies have a very great responsibility to protect their guests against infections.

Allergens are also the excrements of the house dust mite. These spiders are not visible to the naked eye, they feed on hair and skin cells, which we are constantly losing. They are available in all fabrics, which can be used by us but can not be washed. If liquid comes into contact with mite droppings, a black fungus is produced, (Aspergillus niger).

The symptoms of an attack by this fungus are manifold, ranging from allergic reactions and severe breathing to asthma and other serious pulmonary diseases. But the auditory canal may also be infected or inflammation may occur within the abdomen.

Allergens can cause allergies!

The problem is that these allergy diseases are chronic and chronic diseases can alter our genes. So it is possible that the following generations are already born with these diseases.

With this product, textile hygiene is easy and can be done by Anybody can be handled safely.

THMS Textile Hygiene Spray has also been tested and approved by international universities for its 100% effectiveness. Hotels that disinfect mattresses and pillows after every user receive the THMS Hygiene Certificate. This also includes cleaning the mattresses and pillows every six months by suction using microfilters of dead parasites and pathogens.

Only then will the new, 6 months valid THMS textile hygiene certificate be handed over to

the hotel.

Only so guests can be sure to sleep on allergen-free, disinfected and excitement-free mattresses.

The product before each freshly apply the mattress and head pillow with a spray from the environmentally friendly pump-spray bottle from a distance

Of about 50 cm above the fabric, is sufficient for 1 square meter textile surface. The fine aerosol penetrates deep into the tissue and acts immediately. The fresh linen can be applied immediately. In addition, this product smells pleasant and saves them the room spray.

Even when traveling in hotels, who do not care about your infection protection.

250 ml sufficient for 1 year

**Infection protection
of their mattress**

With best wishes for your health
